

## ABSTRACT

The system includes: a first mobile communication terminal (100) (e.g., portable information terminal) having one or more first wireless LAN interfaces (30,31) of wireless LAN client function; and a second mobile communication terminal (200) (e.g., cellularphone) having a second wireless LAN interface (18, 19) having a wireless LAN access point or wireless LAN client function. When the user is in a wireless LAN hotspot area (32), the user makes wireless LAN access using the first mobile communication terminal (100). When the user is located at the boundary of the wireless LAN hotspot area (32), wireless access is kept automatically by way of the second mobile communication terminal (200). In this way, it is possible to enjoy the merits of both the mobile communication system and the wireless LAN system.
